NMR spectra were obtained on Bruker AVANCE 400 spectrometer (400 MHz for ¹H NMR, 100 MHz for ¹³C NMR) and measured in CDCl₃ or DMSO-d₆. Chemical shifts were recorded in ppm relative to internal standard CDCl₃, and coupling constants were reported in Hz. The high resolution mass spectra were recorded on VG Autospec Ultima spectrometer. All reactions were carried out in oven-dried glassware under a N₂ atmosphere. All solvents were distilled from the indicated drying reagents right before use: CH₂Cl₂ (P₂O₅) and MeCN (CaH₂). The normal work-up included extraction, drying over Na₂SO₄ or MgSO₄ and evaporation of volatile materials *in vacuo*. Purifications by column chromatography were performed using Merck silica gel 60 (230 ~ 400 mesh). DMF = *N*, *N*-Dimethylformamide, HBTU = O-Benzotriazole-*N*,*N*,*N'*,*N'*-tetramethyl-uronium-hexafluoro-phosphate, HOBt = Hydroxybenzotriazole, DIEA = Diisopropylethylamine.
